ACKNOWLEDGEMENTS

I would like to express my gratitude to my advisor, Dr. Janice Killian, for sharing her love of research with me and encouraging and guiding me throughout my graduate career. Her enthusiasm and belief in my abilities have truly inspired me. I would also like to acknowledge the other members of my thesis committee, Dr. Keith Dye and Dr. Carolyn Cruse, for their commitment and advice. Finally I want to thank my parents, Charles and Cara Speer, who instilled in me the importance of education from a very early age. Throughout my graduate studies, they supported me in every way imaginable and made it so easy for me to follow my dreams. Without them, this would not have been possible.

ABSTRACT

In an effort to explore the relationship between socioeconomic status (SES) and music ensemble achievement in competition, the author of this study examined the ratings of Texas high school and middle school bands and choruses (N = 4357) at concert and sightreading contests, as well as the SES of each school. In addition, the author considered whether the association of SES and contest ratings differed between bands (n = 2414) and choruses (n = 1943); high school (n = 2202) and middle school (n = 2155) ensembles; and between schools' top (varsity) ensembles (n = 2501), second (non-varsity) ensembles (n = 1578), and lower (sub non-varsity) ensembles (n = 278).

The University Interscholastic League (UIL) governs Texas public school academic, athletic, and music contests. Each spring UIL band and chorus concert and sightreading contests are held across Texas. The 2012 UIL contest results were used in this study. The two ratings for each ensemble (one for concert and one for sightreading) were averaged together to create one composite rating for each ensemble. For analysis purposes, schools were categorized into three groups based on school SES, which was measured as the percentage of economically disadvantaged students for each school, according to data from the Texas Education Agency (TEA).

Results indicated that lower SES schools received lower ratings at contest than those with higher SES. These differences in ratings were statistically significant between all three SES groups: high-SES, middle-SES, and low-SES. The impact of SES did not differ significantly between bands and choruses; between high school and middle school ensembles; or between varsity, non-varsity, and sub non-varsity ensembles.

CHAPTER I

INTRODUCTION

The Child's Bill of Rights adopted by the National Association for Music Education (2013) states, "As their right, all children must receive the finest possible education in music, every child must have an equal right to study music, and the quality and quantity of children's musical instruction must not depend upon their geographical location, social status, racial or ethnic status, urban/suburban/rural residence, or parental or community wealth." Despite this ideal, not all children in this country are given the same musical opportunities and experiences. Researchers have demonstrated a myriad of ways in which the socioeconomic background of a child can impact the quality of his/her education. Relationships have been found between socioeconomic status and administrative and parental support, attitudes of teachers and students, amount of funding, quality of instruction, academic achievement, musical aptitude, and music program retention. To what extent does socioeconomic status impact the quality of music education in this country? What impact does it have on musical achievement? For middle school and high school ensembles, ratings at festivals or contests are often used as a measure of musical achievement. This study explores the relationship between socioeconomic status and the ratings of Texas middle school and high school bands and choruses at concert and sightreading contests.

CHAPTER II

REVIEW OF RELATED LITERATURE

Impact of Socioeconomic Status

Bornstein and Bradley (2003) defined socioeconomic status (SES) as "the relative position of individuals, families, or groups in stratified social systems where some societal values (e.g., occupational prestige, education) are not uniformly distributed" (p. 2). Researchers have demonstrated the impact SES can have on general education as well as music education.

According to Albert (2006a), administrative support is essential to the creation of a musically rich environment for students. Researchers suggest that SES might influence both the initial establishment of and the ongoing perception of a school's music program, which can possibly affect administrative support for the program (Albert, 2006a; Corenblum & Marshall, 1998). Corenblum and Marshall (1998), Doyle (2012), and Renfro (2003) found lower SES to be associated with lower administrative support. In her survey of urban elementary school music teachers, Doyle (2012) found a positive correlation between teachers' perceived lack of administrative support and the percentage of students at the school receiving free or reduced lunch. Specifically Doyle explained, "The most significant and common support-related complaints from the teachers had to do with over-scheduling, lack of resources, and lack of classroom management support" (p. 48).

Lack of administrative support for school music programs can result in reduced funding for these programs (Corenblum & Marshall, 1998; Hinckley, 1995), funding that

is vital to the development of high quality music education (Albert, 2006a). Albert (2006a) stated that "although instrumental music teachers direct learning activities, administrators and school districts create school support for instrumental music programs by deciding what resources will be allocated for them" (p. 42). Kozol (1991) and Renfro (2003) documented the inequalities in education, pointing to the poor quality or lack of facilities and equipment in lower SES situations due to lack of funding.

Researchers have demonstrated that in many cases, particularly with bands, the funding provided by the school for the program is woefully inadequate. In Prescott's study (1982), only 24% of band directors said that their programs were fully funded by the local school board. Similarly, questionnaires sent to music teachers in North Carolina revealed that, in that state, band programs were required to raise nearly half of their funding (Chenault, 1994). Galloway (1986) found a comparable situation in Alabama: his survey of public high school band directors showed that 85% of the bands received most of their funds for the operation of band activities from their band parent booster organizations, and 70% of their total income was received from non-school sources such as this. Logic would indicate that music programs of lower SES students may be put at a disadvantage when they are forced to raise so much of their funding themselves.

Costa-Giomi and Chappell (2007) documented some of the inequalities that exist among band programs of differing SES. They sent questionnaires to the band directors from 25 schools of contrasting SES within one of the largest school districts in Texas in order to gather information about the teachers, the music programs, and the teachers' perceptions about their schools. The schools were arranged into three groups based on the percentage of students at the school classified as economically disadvantaged: less

than 33%, between 33 and 66%, and more than 66%. The data gathered with the questionnaire were analyzed based on economic classification. Differences among contrasting SES schools were found in the number of students taking private lessons and program fees. The percentage of students taking private lessons was highest (6.8%) in the high SES schools and lowest (.52%) in the low SES schools. In addition, fees collected by the band director (such as participation fees, instrumental rental fees, trip fees, etc.) and the proportion of funds raised per student were highest in the high SES schools and lowest in the low SES schools. On average, schools with the lowest percentage of economically disadvantaged students had fees of $321 and raised $77 per student, and those with the highest percentage of economically disadvantaged students had fees of $84 and fundraised $20 per students.

The nominal and ordinal data from the questionnaire were analyzed with Chi squared tests. Analyses according to the SES status of the school showed significant differences for parental support, involvement of parents, booster clubs, availability of outside funds, availability of financial aid, and adequacy of technological resources. In general, more teachers from high SES than medium or low SES reported having very supportive parents, parents very involved in booster clubs, more adequate technological resources, and financial aid for students. More medium SES schools received outside funding than did high or low SES schools.

In addition, all high SES schools in the study reported an increase in student participation. Costa-Giomi and Chappell theorized that the higher financial revenue and student financial resources of these schools allowed them to provide more private lessons and better technological resources, instruments, and classroom equipment for their

students. These incentives, along with the support of parents, led to more students joining the programs. The lower SES schools had less fundraising and collected fewer fees. This may be why they could offer less financial aid to students. Less than 30% of these schools reported offering financial aid while 100% of the high SES schools did. These low SES schools also had less supportive parents and less adequate facilities, which may be why these directors reported a 50% decrease in participation.

Like Costa-Giomi and Chappell (2007), Corenblum and Marshall (1998) and Renfro (2003) also found SES to be a predictor of parental support of school music programs, with low SES being associated with low parental involvement. Hinckley (1995) indicated that parents of low SES children are often not involved in their students' music programs due to work schedules or not feeling comfortable in the school environment. In addition, "low SES parents may value school activities such as instrumental music programs, but the associated costs may prohibit their children from participating…Monetary investments necessary to participate in an instrumental program include obtaining and maintaining an instrument and purchasing supplies such as reeds, oil, strings, and sheet music" (Albert, 2006a, p. 39).

Hoover-Dempsey, Bassler, and Brissie (1987) investigated parental involvement in the school setting by surveying teachers and principals from 66 elementary schools of varying sizes and demographics. The five criterion values about which the professionals were asked were parent-teacher conferences, parent volunteers, parent tutoring, parent home instruction, and parent support. The SES of the school recorded significant correlation with all five criterion values, especially parent-teacher conferences and parent volunteers. The authors of the study speculated that higher SES parents, realizing the

importance of education and possessing the confidence of their right to be involved, may take a more active role than their lower SES counterparts. "Higher SES parents may also feel greater confidence in the value of their contributions to the school" (p. 430).

Furthermore, SES may influence the attitudes of the students themselves toward school music programs. In their study of high school music ensemble students in the United States, Elpus and Abril (2011) found SES to be significantly associated with participation in music ensembles. They created a national demographic profile of American band, orchestra, and choir students using data from the Education Longitudinal Study of 2002, "a nationally representative multiple-wave longitudinal study conducted by the U.S. Department of Education's NCES [National Center for Education Statistics]" (p. 131). Data showed that students in the lowest SES quartile were underrepresented in school music programs, and those from higher SES backgrounds were overrepresented. Music students were 1.7 times more likely to be in the highest SES quartile than the lowest. In fact, higher SES students have been shown to be more likely to participate in all extra-curricular activities, including fine arts (McNeal, 1998). Various factors may account for this differing involvement in extra-curricular activities. It may be due to the low SES students' need to work after school (Renfro, 2003). Also, sometimes these students don't have room in their school schedule for arts classes because they must take remedial classes (Renfro, 2003).

It is also possible though that these students want to be involved in music programs but are just not given the opportunity. In her research regarding string education in the United States, Smith (1997) discovered that string education was offered least in school districts of low SES. In fact SES was the most important predictor of

whether elementary schools offered string education and, along with school size, was also the most important predictor for offerings in middle school and high school. Abril and Gault (2008) sought to profile secondary school music programs in the United States by surveying principals about the music offerings at their schools. To compare the variety of musical offerings at schools of differing SES levels, a diversity of course offerings score was developed for each school by adding the number of different courses being offered. Schools were divided into three categories: high SES (0% to 25% free or reduced lunch), middle SES (26% to 50% free or reduced lunch), and low SES (greater than 50% free or reduced lunch.) Mean diversity scores for each category were calculated, and a significant difference in music course offerings due to school SES was found.

In addition, the teaching in low socioeconomic conditions is not always of a high quality (Kozol, 1991). Researchers have indicated that teachers often have lower expectations and standards for students in poorer schools (Doyle, 2012; Hinckley, 1995; Kozol, 1991; Ogbu, 1974). Pre-service teacher training has not always adequately prepared teachers to teach in these settings (Fiese & DeCarbo, 1995), which are frequently understaffed and overpopulated (Hinckley, 1995). This may be why in Corenblum and Marshall's study (1998) of band students, students' perceptions of band teacher attitudes were more negative in lower SES settings. Doyle (2012) also found in her survey of music teachers in urban elementary schools that "when teachers taught at schools with lower SES…and higher percentages of free and reduced lunch, their attitudes were less positive" (p. 45). These difficult circumstances can lead to high

teacher turnover in low SES schools, which may in turn lead to low retention rates in music programs (Renfro, 2003).

Several researchers have found that SES may significantly impact school music program retention (Albert, 2006a; McCarthy, 1980). Kinney (2010) examined students from two Midwestern metropolitan middle schools who shared the same band director. 6th graders (*n* = 402) and 8th graders (*n* = 340) were included in the study. Of those, 17.9% of the 6th graders were enrolled in band, and 14.2% of the 8th graders were enrolled. Free or reduced lunch status was used to approximate SES. SES was not found to be a predictor of initial enrollment in 6th grade band. It was, however, a predictor of enrollment in 8th grade band. Therefore, SES may impact retention. 8th graders who were not eligible for subsidized meals were twice as likely to be enrolled in band as those who were eligible.

Corenblum and Marshall (1998) sought to develop and test a model to predict student intentions to continue with their musical studies, surveying 9th grade band students (*N* = 253) from 7 schools in Winnipeg, Canada. Questionnaires assessed student attitude toward band; outside musical interests; perceptions of the attitudes of their parents, band teachers, and the school toward the band program; and success or failure attributions for music classes. Students reported their grades in core subjects and their intention of whether or not to continue band next year. Band teachers also rated each student's performance in class, ranked the students, and estimated the students' band grades in grades 7 through 9. SES level was estimated by students' answers to questions about their parents' occupations, the number of musical instruments rented or owned by the family, and whether the student owned their instrument. Results found that SES

predicted perceived parent support and outside musical interests, and both of these variables predicated intentions to take band next year. SES also predicted perceived school support, which predicted student perceptions of band teacher attitudes, which predicated student attitudes toward band, and these attitudes correlated with intention. Corenblum and Marshall (1998) stated that SES reflected, in part, norms, beliefs, and values about school and education. Those beliefs and values facilitate and support continued interest in and study of music by providing the resources and home environment to do so. Students from higher SES backgrounds attend schools where the band program in supported, and support from parents and others impacts student attitude. The authors go on to say:

> For individuals in privileged conditions within the culture, the belief that people should be encouraged to excel at and continue in music and scholastic endeavors seems the right thing to do. To do otherwise would seem inconsistent with beliefs these students may hold about the value of talent and the nature of individual achievement. (p. 136)

Klinedist (1991) also examined the ability of selected factors to predict retention, as well as performance achievement, in beginning instrumentalists. Eleven factors were examined as possible predictors: musical aptitude, scholastic ability, math achievement, reading achievement, general music teacher rating, attitude about music, self-concept in music, music background, motivation to achieve in music, SES, and instrument adaptation assessment. 5^{th} grade students (N = 205) enrolled in beginning instrumental classes in the Cumberland Valley School District in Pennsylvania were used as subjects. The population of the area is mostly white, middle to upper class families. The

occupation and education of the head of the household was used to determine the SES level for each student. Students were evaluated in terms of the following criterion measures: a. adjudicator rating of performance b. instrumental music teacher rating c. retention. Student performance achievement was measured through a performance exam consisting of three etudes. Also each subject's music teacher gave him a rating of student achievement and progress. Retention was measured by instrumental teacher records. Stepwise multiple regression analyses were used to determine the degree of relationship between the predictor variables and the criterion variables. A two-part discriminant function analysis was used to determine the predictor variables on retention of students. Results indicated that SES had no significant impact on adjudicator rating of performance or teacher rating of performance, but SES, self-concept in music, reading achievement, scholastic achievement, and math achievement were found to be significant predictors of student retention. These independent variables predicted retention with 78% accuracy. SES was found to be the best predictor of student retention.

SES may affect general academic achievement and standardized test scores (Clark, 1983; Kinney & Forsythe, 2005; Miksza, 2007). In an early study, DeHaan and Havighurst (1957) ranked schools by the average SES of the students attending. The school with the highest SES had the highest achievers in both intellectual talent and artistic talent. Similarly, Stang (1955) found that gifted children (defined as those of high intelligence and high creativity) were more frequently found in homes of higher SES. Stang also demonstrated that gifted children of lower SES had problems realizing their potential. More recently, Kinney (2008) looked at fourth, sixth, and eighth grade achievement test scores and found that higher SES students scored significantly higher.

Nichols (2003) explored information that might predict and describe students who failed to pass the Indiana state exit exams in English/language arts and mathematics. All of the students studied were those who had failed to meet the proficiencies. Data were collected for the graduation classes of 2000 (n = 2000), 2001 (n = 2056), and 2002 (n = 2364). Students take the exit exam initially in 10th grade. In addition to the exit tests, the data explored earlier test results from the 8th, 6th, and 3rd grades, as well as history of school attendance and grade point average (GPA). In addition, information was collected about gender, ethnicity, and SES (as indicated by eligibility for subsidized lunch). Lower income students had a greater failure rate (sometimes twice as much) as higher income students on the proficiency tests. Although all of the students in the study did not pass the proficiencies, the higher income students had higher GPA's. Also for each graduating class, low income students averaged 3-4 more absences per year than their higher income peers who also failed to meet the state proficiencies. Nichols concluded that this pattern of poor attendance for these students, which began early in their educational careers, robbed them of the teacher contact and exposure that students who experience early-career academic struggles so desperately need.

Fitzpatrick (2006) conducted a similar study in Ohio, seeking to describe the students who did not pass that state's proficiency tests. Fitzpatrick looked at the test scores from 4th, 6th, and 9th grades for students (N = 15,431) from the Columbus Public Schools. The results from each year's subject tests of citizenship, math, reading, and science were analyzed using a two-tailed t test. In 7 of the 12 tests, high SES students outscored low SES students.

The relationship between SES and academic achievement may extend to individual musical aptitude and achievement as well. This topic was well-researched in the 1960's through 1980's but apparently has been explored less in the past thirty years.

Daniels (1986) found that high school choir students who represented a higher socioeconomic bracket scored better on a sightreading test than those in a lower bracket. Twenty high school mixed choirs were given a four part harmony sightreading test, which was recorded and adjudicated by five expert judges. This study found that information about the SES of the school and the students had more impact on the results of the test than information about the chorus curriculum.

Taebel and Coker (1980) found a positive correlation between SES and the scores of elementary music students on Colwell's Music Achievement Test 1. The researchers indicated that low SES students learn at about the same rate as others, but they start much further back. On the other hand, in his research, Marciniak (1974) found no significant effects due to SES on the musical perception of 11th and 12th grade band students in Illinois as measured by the Schimke "Test of Musical Perception,".

Van Zee (1976) measured the musical abilities of randomly selected kindergarteners (N = 80) from four Midwestern schools of varying SES. The students were given two tests, one which measured aural discrimination and verbal descriptive responses to test items and one which required musical performance on a simple keyboard instrument, showing understanding of the musical terms used in the first test. One of the schools was classified as educationally deprived under the provisions of the Elementary and Secondary Education Act of 1965, Title I. The students from this lower SES school had the lowest achievement on the music test.

Sergeant and Thatcher (1974) examined the relationships between intelligence, musical abilities, home music environment, and social/cultural and economic characteristics of the home. Students, 10 and 11 year olds from a wide variety of SES backgrounds, were given questionnaires about their musical experiences, musical interest and abilities of their family, parents' occupations, and the family's cultural habits. Intelligence was measured using the Cattell Culture Fair intelligence test, which involves matching figures, figure orientations, and rejection of irrelevant figures. Musical ability was measured using rhythm matching and melodic matching tests. The researchers found that musical ability, home musical environment, and intelligence "all bore direct linear relationships to the socio-economic background of the home" (p. 54). Furthermore, Sergeant and Thatcher concluded that:

> Music, as a form of behavior, appears to be more characteristic of higher socio/cultural and economic groups than of groups lower on theses scales. Inevitably, therefore, the home musical environment enjoyed by a child is allied to the socio-economic circumstances in which he was raised. The child from the favored background (both socio-economically and musically) is thus more likely to develop high levels of musical ability. (p. 55)

Rainbow (1965) looked at variables hypothesized to be associated with musical aptitude: pitch discrimination, tonal memory, rhythm, musical memory, academic intelligence, school achievement, sex, chronological age, musical achievement, musical training, home enrichment, interest in music, participation in music by relatives, and socioeconomic background. The author developed the following definition of musical aptitude:

> Musical aptitude refers to potential talent in music. As with other forms of learning, high aptitude does not necessarily mean high achievement will result, but it does indicate that under favorable conditions, high achievement is possible. A person who possesses a high level of aptitude for music will have an exceptional awareness for musical sound. This awareness, or talent, manifests itself in the manner in which a student is readily able to grasp, see relationships in, make generalizations from, and relate and organize ideas presented through the media of music. (p. 4)

The participants were elementary, junior high, and high schools students (*N* = 291) enrolled in general music classes at the Laboratory School of the State University of Iowa. Their music teachers used Rainbow's definition of musical aptitude to evaluate their students and break them down in to three groups: the highest 20%, the middle 60%, and the lowest 20%. SES was assessed by evaluating the education and occupation of the head of the household. A significant correlation was found between SES and musical aptitude at all levels: elementary, junior high, and high school.

Good (1997) further investigated the relationship between musical aptitude and SES. For his experiment, the Bentley "Measures of Musical Ability Test" (BMMA) was given to 7 and 8 year old children (*N* = 897). The test is divided into sub-tests of pitch discrimination, chord analysis, tonal memory, and rhythmic memory. Seventeen schools participated, and the percentage of students in each school eligible for free school meals was collected. Linear regression analysis was used to examine a possible connection between the percentage of students in the school eligible for subsidized meals and BMMA performance. The initial analysis used the total test score as the dependent

variable and eligibility for free meals as the independent variable. Linear regression revealed a highly significant effect for SES. Schools receiving larger numbers of subsidized meals tended to perform worse on the test. Similar relationships were found among all four sub-tests.

Rowntree (1970) also used the BMMA to measure musical aptitude. He gave the Bentley test to children between the ages of 7 and 11 ($N = 3000$). Confirming Good's findings, a significant relationship was found (at the .1 level) between test scores on the BMMA and the SES of the school.

Dawkins and Snyder (1972) chose another test, "The Seashore Measures of Musical Talent", to assess musical aptitude. This test measures students' understandings of pitch, rhythm, loudness, time, timbre, and tonal memory. Low SES students ($N = 120$) from a Title I school in a largely poor neighborhood in a Washington DC suburb were selected at random. The students were divided equally by sex and race. Scores of low SES African American and Caucasian students were compared with each other and with national norms on the Seashore. Scores of low SES males and females were compared with each other and with national norms. And scores of the total low SES group were compared with national norms. A series of t tests were performed to determine whether there were significant differences at the .05 level. The mean score of African Americans was lower than Caucasians, although both groups were below the national norms. Students did better on the rhythm test than any other. Mean scores were: National norm = 24, African Americans = 22.8, Caucasians = 23.4. Both ethnic groups had the worst showing on tonal memory, and this test showed a significant difference between the low SES students and the national norm. Mean scores for tonal memory were: National

norm = 20.3, African Americans = 12.3, Caucasians = 16.1. No significant differences were found between male and female students. As a whole, the low SES students scored close to national norms on some portions of the test, but never scored at or above norms.

Strategies for Music Educators

Several strategies have been recommended for music educators in low SES situations. Corenblum and Marshall (1998) and Fiese and DeCarbo (1995) suggested that these teachers need better training. For example, Corenblum and Marshall (1998) advise that teachers should be given accurate expectations about the level of support they may receive from the school and parents in these economically disadvantaged areas. In addition, according to the urban music educators surveyed by Fiese and DeCarbo (1995), teachers must be taught how to deal with "the complex emotions of students from differing social and economic backgrounds" (p. 28). Furthermore, these music teachers indicated that teachers should be prepared for the varying family situations which they may encounter in these schools, including single parent homes, custody battles, teen pregnancy, and students kicked out of their houses (Fieses & DeCarbo, 1995).

A number of sources also promote the importance of making the musical ensemble experience relevant to the lives of lower SES students (Albert, 2006b; Corenblum & Marshall, 1998; Fiese & DeCarbo, 1995). Corenblum and Marshall (1998) suggested that teachers must realize that other programs in the school other than music may have a higher priority, and traditional band programs may not meet the needs of the students in these schools. They advised teachers to consider adapting their programs to be more sensitive to the racial/ethnic diversity of the school (Corenblum & Marshall, 1998). Albert (2006b), Hanshumaker (1989), and Mixon (2005) recommended forming

alternative, culturally relevant ensembles to encourage students' involvement in band and choir through music that is familiar to them. Similarly, Andrews (1967) stated that, "untraditional methods and the inclusion of unorthodox materials may be indicated to reach the disadvantaged and the training of future teachers should reflect the use of such materials and methods" (43). The urban music teachers in Fiese and DeCarbo's study (1995) suggested that "teachers must find a way to relate to the students initially and then adapt the curriculum with that in mind" (p. 28).

Other proposed strategies that may be successful in low SES situations include giving students more ownership in the ensemble processes (Albert, 2006b; Fiese & DeCarbo, 1995), the availability of school-owned instruments (Albert, 2006b; Elpus & Abril, 2011; Ester & Turner, 2009; Mixon, 2005), a safe, family environment within the program (Albert, 2006b; Buford, 2010; Fiese & DeCarbo, 1995), positive relationships between the teacher and students and parents (Albert, 2006b; Buford, 2010; Mixon, 2005), teacher stability (Buford, 2010; Fiese & DeCarbo, 1995), and high standards and accountability for all students (Buford, 2010; Hinckley, 1995).

Music Contests

In recent years, there has been increased emphasis in education on assessment and teacher accountability, with programs such as the White House's Race to the Top (The White House, n.d.). Standardized tests often play a large role in determining teacher effectiveness and student achievement in the "core" disciplines (Hash, 2012). However, for music ensembles, success is usually measured in terms of the skills being taught, and standardized tests do not measure performance skills (Dawes, 1989). Therefore contest ratings often serve the function of measuring teacher effectiveness and student

achievement for these groups (Dawes, 1989; Forbes, 1994) because "these ratings—like standardized tests—provide a third-party evaluation consisting of numerical scores that can be used to compare the achievement of one ensemble to another" (Hash, 2012, p. 83).

Directors often feel pressure from administrators, parents, or their peers to enter contests (Forbes, 1994; Payne, 1997). Adjudicated contests and festivals can put a significant amount of stress on directors (Barnes & McCashin, 2005) because the results can mean job retention or loss and a successful recruiting year or not (Batey, 2002). In addition, the ratings influence the way the director and program are received by administrators, parents, and the community, as these groups often view the quality of student performance as a measure of teacher competency (Forbes, 1994).

The impact of SES on general education and certain aspects of music education has been well-documented. Although despite the importance of contest results in our current educational climate, few researchers have explored the impact of SES on music ensemble achievement in competition.

Schmidt, Baker, Hayes, and Kwan (2006) did investigate this topic. They surveyed 619 teachers who taught general music, chorus, band, or strings in Indiana public schools. In addition, they obtained festival performance ratings for the ensembles from the Indiana State School Music Association. The relationships between the percentage of students in the school receiving free lunch and music program characteristics as reported in the teacher questionnaires were generally non-significant. Nonetheless, a sample of bands receiving distinguished awards for performance at the state festival did represent schools with a significantly lower percentage of students receiving free lunch.

A couple of previous studies have looked specifically at ensemble contest ratings in Texas. The University Interscholastic League (UIL) governs public school academic, athletic, and music competitions in Texas (University Interscholastic League, n.d.a). Each spring the performance and sightreading skills of Texas high school and middle school bands and choruses are evaluated through concert and sightreading contests (University Interscholastic League, 2013). Schools may enter more than one ensemble (e.g. band, chorus) in the contest, with the top ensemble being designated as varsity, the second as non-varsity, and lower groups as sub non-varsity. These different levels of ensemble perform repertoire of varied degrees of difficulty for both the concert and sightreading portions of the contest (University Interscholastic League, 2013). A more detailed explanation of UIL contest procedures appears in Chapter III.

Dame (2010) examined the ratings of Texas choral ensembles at UIL concert and sightreading contests. These choruses (N = 657) represented all geographic regions of Texas and urban, suburban, and rural areas. Dame calculated each school's percentage of disadvantaged students by looking at the percentage of economically disadvantaged students who took the required reading and math state standardized tests. Results were analyzed using basic linear correlation and regression techniques comparing the school's percentage of disadvantaged students to the UIL Concert and Sightreading ratings. Results showed a negative correlation between disadvantaged populations and UIL ratings in every voicing (treble, tenor-bass, mixed) and in every level (varsity, non-varsity, sub non-varsity) of ensemble analyzed.

This present study is designed to replicate and extend previous research (Speer, 2012). The Speer pilot study used the ratings of middle school and high school bands (*N*

= 173) from the 2011 UIL Region 18 Concert and Sightreading Contest. For computational purposes, schools were organized into four groups according to SES. Data were analyzed by means of the Kruskal-Wallis One-Way Analysis of Variance, comparing UIL ratings with SES. Results indicated that lower SES schools received lower ratings at contest than those with higher SES. The highest SES group had the highest mean rating, and the mean ratings were progressively lower for each group of lower SES. The differences among the SES groups, however, were not always statistically significant, suggesting that extreme differences in SES are associated with differences in contest ratings, while smaller differences in SES appear not to have a significant impact. The largest reduction in ratings occurred for the group of schools with the lowest SES (those with more than 75% of their students classified as economically disadvantaged). Although differences in ratings across varying SES were found at both the high school and middle school levels, these differences were greater for middle school bands. Similarly, differences in ratings were found for both varsity bands and non-varsity bands, but these differences were greater for varsity bands. When looking at the varsity level bands only, a very large reduction in ratings was seen for the schools with the lowest SES. This trend was not seen in the non-varsity bands, perhaps due to the fact that many of the very poorest schools, especially those with small or struggling band programs, do not have a second band or do not have one that is viable to send to contest.

Purpose Statement

Although researchers have frequently investigated the impact of SES on individual musical aptitude and achievement, they have largely ignored the impact on ensemble achievement. Nonetheless contest results are often viewed by school

administrators, parents, and community members as a gauge of the effectiveness of music programs and their teachers. Therefore, there appears to be a need for additional research with regard to SES and these contest ratings. By examining a much larger data set than any previous research of its kind, this study purports to more fully explore the relationship between SES and music ensemble achievement by examining the Texas UIL concert and sightreading ratings for bands and choruses.

Several research questions were developed in connection with the primary purpose of this study:

1. What is the relationship between the SES of a school and the ratings of their bands and choruses at UIL Concert and Sightreading Contest?
2. To what extent does SES impact the contest ratings of bands and choruses differently?
3. To what extent does SES impact the contest ratings of high school and middle school ensembles differently?
4. To what extent does SES impact the contest ratings of varsity, non-varsity, and sub non-varsity ensembles differently?

CHAPTER III

METHODOLOGY AND MATERIALS

Background Regarding University Interscholastic League (UIL) Contest Procedures

In order to examine the relationship between SES and contest ratings, results from the 2012 UIL Band and Chorus Concert and Sightreading Contests were analyzed. The University Interscholastic League (UIL) governs Texas public school academic, athletic, and music contests and is the largest inter-school organization of its kind in the world (University Interscholastic League, n.d.a). The music division of UIL is an important part of music education in Texas, with approximately one half million middle school and high school students participating in UIL music events annually (University Interscholastic League, n.d.b). Each spring UIL Band and Chorus Concert and Sightreading Contests are held across Texas (University Interscholastic League, 2013). According to UIL's Constitution and Contest Rules (2013), these contests consist of a concert portion, in which ensembles perform three prepared repertoire selections, and a sightreading portion, in which students read a newly composed piece of music. A panel of three judges evaluates the concert portion of the contest and a separate panel of three judges evaluates the sightreading portion. Each judge gives each ensemble a rating from Division I (Superior) to Division V (Poor). These scores are then used to give each ensemble one rating for their concert performance and one for their sightreading performance. If the ratings of the three judges on one panel do not agree, Table 1 is used to determine the rating to be awarded.

Table 1 Table for computing UIL ratings: three judges, five ratings (University Interscholastic League, 2013).

Rating I	Rating II	Rating III	Rating IV	Rating V
1-1-1	1-2-2	1-3-3	1-4-4	1-5-5
1-1-2	1-2-3	1-3-4	1-4-5	2-5-5
1-1-3	1-2-4	1-3-5	2-4-4	3-5-5
1-1-4	1-2-5	2-3-3	2-4-5	4-5-5
1-1-5	2-2-2	2-3-4	3-4-4	5-5-5
	2-2-3	2-3-5	3-4-5	
	2-2-4	3-3-3	4-4-4	
	2-2-5	3-3-4	4-4-5	
		3-3-5		

The top ensemble within each ensemble type (e.g. band, chorus) from each school is designated as varsity. Second ensembles are designated as non-varsity and lower groups as sub non-varsity. The repertoire that non-varsity and sub non-varsity ensembles are required to perform in both the concert and sightreading portions of the contest is less challenging than that which is required of varsity ensembles (University Interscholastic League, 2013).

Data Collection Procedures

Ratings from the 2012 UIL Band and Chorus Concert and Sightreading Contests were obtained from Texas UILforms.com, a publicly available website. Texas UILforms.com contains the scores of each of the six judges as well as the overall concert rating and overall sightreading rating for each ensemble entered. For this study, these

two overall ratings were averaged into one composite rating for each ensemble. The website also indicates whether the designated level of each ensemble is varsity, non-varsity, or sub non-varsity.

The ensembles (N = 4357 separate ensembles representing 1531 different schools) examined in the study include varsity, non-varsity, and sub non-varsity middle school and high school bands and choruses. These ensembles represent all geographic regions of Texas and all community types, including charter schools, as indicated by the Texas Education Agency's classification of public school districts. "These community types, or 'district types,' group districts into eight categories ranging from major urban to rural. Charter school districts make up a ninth category" (Texas Education Agency, 2013).

Furthermore, the schools represent a wide range of socioeconomic statuses (SES), from .5% to 100% of the school's student population designated as economically disadvantaged. In this study, SES was defined using data from the Texas Education Agency (TEA). TEA calculates the percentage of economically disadvantaged students for each school in Texas by taking the sum of all students eligible for free or reduced lunch or eligible for other public assistance and then dividing by the total number of students (Texas Education Agency, 2012c). These data for Texas schools are published annually in the Academic Excellence Indicator System (AEIS) reports (see Texas Education Agency, 2012b). AEIS reports from the 2011-2012 school year were employed in this study, the same school year from which the UIL results were drawn.

Eligibility for free or reduced lunch is frequently used as a measure of poverty and socioeconomic disadvantage (Doyle, 2012; Fitzpatrick, 2006; Good, 1997; Kinney, 2008; Kinney, 2010; Kinney & Forsythe, 2005; Nichols, 2003). Free or reduced lunch is

issued on the basis of the Income Eligibility Guidelines which are employed by all schools, institutions, and facilities participating in the National School Lunch Program (Food and Nutrition Service, USDA, 2013). For the 2011-2012 school year, a family of four would need to make $41,348 or less annually to receive free or reduced lunch (Food and Nutrition Service, USDA, 2011).

It is important to note that while each school was labeled by its percentage of economically disadvantaged students, no attempt was made to assess the SES of individual students. In addition, because all of the data employed in this study are available to the general public, no IRB review was necessary.

Factors

In order to address the research questions, the information about each ensemble was organized into four factors. The purpose was to determine not only how SES impacts the composite UIL ratings but also how SES and the other factors combine to impact SES. The information and ratings for each ensemble appear in Appendix B. This appendix also includes the city of each ensemble and the voicing of each chorus (mixed, treble, or tenor/bass), but the researcher chose not to examine these pieces of information. The four factors that were used are:

1) SES: high-SES, middle-SES, low-SES

As in Costa-Giomi and Chappell (2007), schools were arranged into three SES groups based on the percentage of students at the school classified as economically disadvantaged: less than 33% (high-SES), between 33 and 66% (middle-SES), and more than 66% (low-SES). This differs from the Speer pilot study (2012), in which schools were organized into four groups according to SES. In the pilot study, statistically

significant differences in contest ratings due to SES were not found between the middle two groups or between the lowest two groups. Therefore, only three groups were used in this present study.

2) Grade level at which the ensemble competed: high school or middle school

3) Ensemble type: band or chorus

4) Varsity level: varsity, non-varsity, or sub non-varsity

Remember that these three different varsity levels of ensemble perform repertoire of varying degrees of difficulty. UIL does have a procedure in place by which an ensemble from a brand new music program or one that is struggling can petition to compete at a lower level (University Interscholastic League, 2013). For example, the top band from a particular school could petition to compete as a non-varsity band rather than a varsity band. In a case such as this, because UIL considered the band non-varsity and required the ensemble to perform non-varsity level repertoire, the ensemble was also treated as non-varsity for this present research.

Table 2 shows the N values for the four factors.

Table 2 N values for factors

Factor	**Level**	***N***
SES	High-SES	1281
	Middle-SES	2218
	Low-SES	858
Grade level	High School	2202
	Middle School	2155
Ensemble Type	Band	2414
	Chorus	1943
Varsity level	Varsity	2501
	Non-varsity	1578
	Sub non-varsity	278

CHAPTER IV

RESULTS

Data were analyzed using SPSS version 22 by means of an ANOVA with a fixed-effects model. UIL composite rating was the dependent variable, and the four independent variables were SES, grade level, ensemble type, and varsity level.

Results indicated that there was a statistically significant difference in the UIL composite ratings of schools on the basis of SES, $F(3, 2) = 52.48$, $p < .001$. Differences between all three SES groups were significant at the $p < .001$ level. Tukey's HSD test and the Bonferroni correction confirmed these findings.

Figure 1 shows the mean UIL composite scores for the high, middle, and low SES groups. Remember that UIL ratings range from 1 to 5, with 1 being the highest rating.

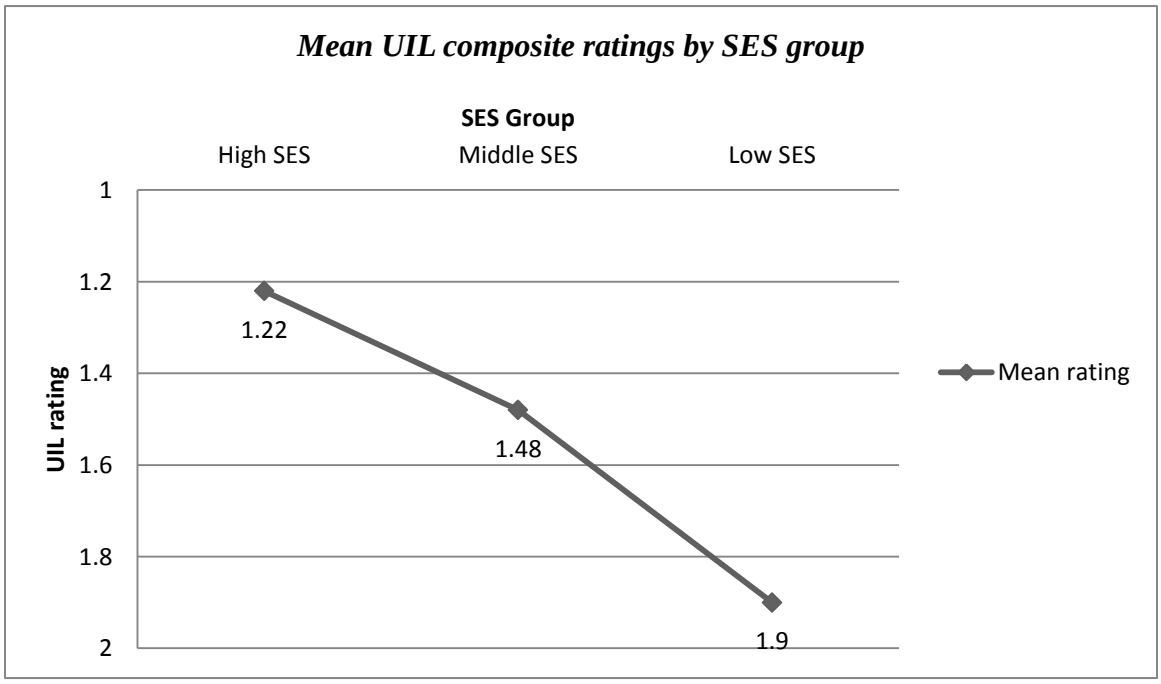

Figure 1. Mean UIL composite ratings for the three SES groups.

As seen in Figure 2, all levels of high-SES ensembles (varsity, non-varsity, and sub non-varsity) outperform the varsity ensembles from middle-SES schools, and all levels of middle-SES ensembles outperform the varsity ensembles from low-SES schools. This is despite the fact that varsity ensembles are presumably more experienced and at a higher performance level than non-varsity and sub non-varsity groups. In other words, SES differences across schools matter more than performance levels within schools.

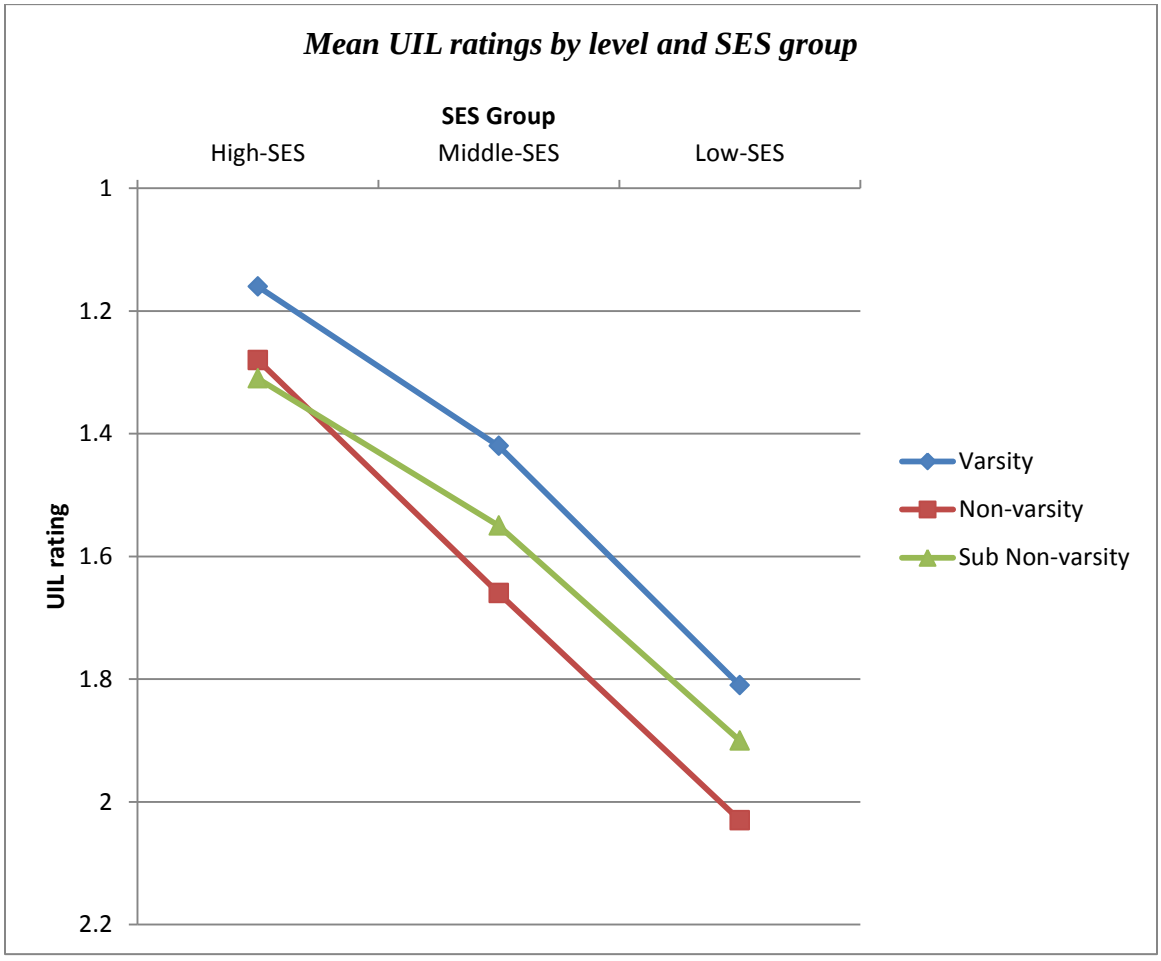

Figure 2. Mean UIL composite ratings for varisty, non-varsity, and sub non-varsity bands by SES group.

The overwhelming importance of SES can also be seen from the effect size indicated by the partial eta squared shown in Table 3. After SES, the next largest effect size was the varsity level of the ensemble. This demonstrates again that SES of the school matters more than the level of the ensemble.

Table 3 Effect size

Source	Partial Eta Squared
SES[a]	.024

The results further showed that the impact of SES did not differ significantly across grade level, $F(3, 1) = .08$, $p = .93$); ensemble type, $F(3, 1) = 1.35$, $p = .26$); or varsity level $F(3, 2) = .54$, $p = .71$.

Although the purpose of this study was to look at the impact of SES, the data analyzed did allow for the study of other factors as well. Table 4 shows the complete results of the ANOVA.

Table 4 ANOVA results

Factor	Type III Sum of Squares	df	Mean Square	F	Sig.
SES[a]	48.846	2	24.423	52.479	*.000
Grade level[b]	.354	1	.354	.761	.383

[a] High SES, middle SES, or low SES [b]High School or middle school [c]Band or Chorus [d]Varsity, non-varsity, or sub non-varsity
*$p < .001$

A statistically significant difference in contest ratings was found for the factor of varsity level. Of the three groups (varsity, non-varsity, and sub non-varsity), only differences between varsity and non-varsity ensembles were significant, with varsity ensembles ($M = 1.48$, $SD = .02$) receiving better ratings than non-varsity ensembles ($M = 1.63$, $SD = .02$). These results were corroborated by Tukey's HSD test and the Bonferroni correction. Beyond SES and varsity level, significant differences in ratings were not found for any other factors or combinations of factors.

Results may be summarized as follows: There was a statistically significant difference between the UIL ratings of schools of differing SES, with lower SES being

associated with lower ratings. The differences were significant between all three groups: high SES, middle SES, and low SES. The impact of SES did not differ significantly across grade level, ensemble type, or varsity level.

CHAPTER V

DISCUSSION

Research Questions

The purpose of this study was to examine the impact of SES on band and chorus contest ratings by looking at the results of the 2012 UIL concert and sightreading contests. Four specific questions were posed:

1. *What is the relationship between the SES of a school and the ratings of their bands and choruses at UIL Concert and Sightreading Contest?*

There is a significant difference between the contest ratings of schools of differing SES, with high SES schools receiving the highest ratings and low SES schools receiving the lowest ratings. This confirms findings by Schmidt, Baker, Hayes, and Kwan (2006); Dame (2010); and Speer (2012) that ensembles from schools with a lower percentage of students receiving free or reduced lunch perform significantly better at contest than those from schools with a higher percentage of students receiving free or reduced lunch. However, the data set analyzed in this present study was much larger than these previous studies. Unlike the Speer pilot study (2012), in the present study significant differences were found between the ratings of all SES groups: high, middle, and low.

While it may not be surprising that higher SES schools perform better, the extent to which SES matters is startling. This point is really driven home by the fact that all levels of ensemble (varsity, non-varsity, and sub non-varsity) at each SES level out-perform varsity groups from the lower SES level. In most cases, students are placed into particular bands or choruses within their school based on an audition or based on

experience level. For example, a sub non-varsity group is likely to consist of the younger, less-experienced students who performed relatively poorly on an audition. Yet high SES sub non-varsity groups receive better contest ratings on average than middle SES varsity groups. The same result is seen between sub non-varsity middle SES ensembles and low SES varsity ensembles. Although non-varsity and sub non-varsity groups are able to perform less challenging literature at UIL than varsity groups, an expected outcome might be that these lower groups will not play their concert selections as well as the varsity ensembles and will struggle more with the sightreading. The results of this study, however, reveal that when looking at contest ratings, SES differences between schools matter more than experience or ability levels within schools of similar SES.

2. *To what extent does SES impact the contest ratings of bands and choruses differently?*

SES does not impact the contest ratings of bands and choruses in a significantly different way. One hypothesis might have been that band ratings would have been affected by SES more than chorus ratings since band programs have the added expense of purchasing instruments. This would have been in line with the research of Prescott (1982), Chenault (1994), Galloway (1986), and Costa-Giomi and Chappell (2007) that demonstrated that the majority of band programs are not fully funded by the school and must raise much of their funds from outside sources. Costa-Giomi and Chappell (2007) showed that higher SES school bands had more income because they charged more in program fees and also fundraised more per student than the low SES bands. Surprisingly though, in this current study, no significance differences were found in the way SES

impacts bands and choruses. If anything, there is suggestive evidence that at the high school level chorus ratings have a bigger effect of SES. As can be seen in Figure 3, the ratings difference between bands and choruses at the high and middle SES levels is almost nothing. At the low SES level, however, there is a large gap. Remember that UIL ratings range from 1 to 5, with 1 being the highest rating.

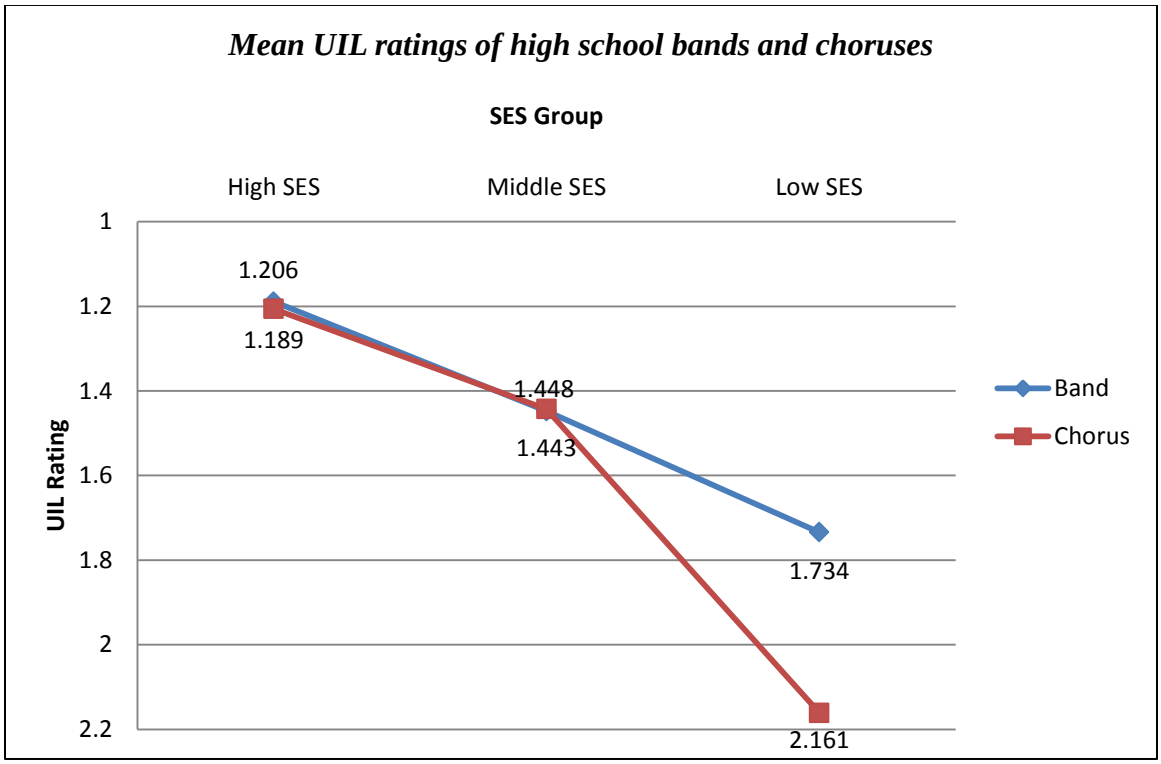

Figure 3. Mean UIL composite ratings for high school bands and choruses.

One possible explanation is that the poorest students in the low SES schools cannot afford the costs associated with band such as program fees or purchasing an instrument, reeds, valve oil, etc. Albert (2006a) pointed out that these costs may prohibit low SES students from participating in instrumental music programs. Costa-Giomi and Chappell (2007) demonstrated that because low SES band programs are not able to do as much fundraising and unable to charge as much in participation fees, they are less likely

than high SES schools to be able to offer financial aid to students who need it to participate in the program, despite the fact that students in these low SES schools are the most in need of this kind of help. Perhaps these financial issues cause the poorest students in the low SES schools to choose chorus over band, causing these choruses to score lower at contest. Remember that this study looked only at the overall SES of each school, not the SES make-up of each specific ensemble. Further studies could explore possible differences in SES between bands and choirs at low SES schools and how this may impact contest ratings. It might also be worthwhile to compare the band and chorus directors in low SES schools to see if there is a significant difference in their level of qualification for the job.

3. *To what extent does SES impact the contest ratings of high school and middle school ensembles differently?*

SES does not impact the contest ratings of high school and middle school ensembles in a significantly different way. This result diverges from Speer's findings (2012) in which there was a greater ratings difference due to SES for middle school bands compared to high school bands. Because of the way that pilot study was conducted though, there was no way to tell if that difference between middle school and high school bands was significant.

4. *To what extent does SES impact the contest ratings of varsity, non-varsity, and sub non-varsity ensembles differently?*

SES does not impact the contest ratings of varsity, non-varsity and sub non-varsity ensembles in a significantly different way. Again, this result contradicts Speer (2012), in which there was a greater ratings difference due to SES for varsity bands compared to

non-varsity bands. As before, there was no way in the pilot study to tell if the difference between varsity and non-varsity bands was significant.

Implications

The results of this study should be generalized with caution because these data were from one state in one year. Further studies are necessary to see if these results can be applied to a broader population. In addition, the sample sizes of the SES groups were vastly different: high-SES (N = 1281), middle-SES (N = 2218), and low-SES (N = 858). The sample sizes of the varsity levels were also tremendously different: varsity (N = 2501), non-varsity (N = 1578), and sub non-varsity (N = 278). It would be worthwhile to conduct similar further studies with equal sample sizes.

The results of this study confirm the findings of research discussed in Chapter II that low SES is often associated with low achievement. It is not within the scope of this study to determine the cause of differences in contest ratings for schools of different SES. These differences could be due to any one of the factors discussed in Chapter II that are associated with low SES, including lack of administrative support (Albert, 2006a; Corenblum & Marshall, 1998; Doyle 2012; Renfro, 2003), inadequate funding (Corenblum & Marshall, 1998; Costa-Giomi & Chappell, 2007; Hinckley, 1995; Kozol, 1991; Renfro, 2003), fewer students taking private lessons (Coast-Giomi & Chappell, 2007), lack of parental support (Corenblum & Marshall, 1998; Costa-Giomi & Chappell, 2007; Hinckley, 1995; Hoover-Dempsey, Bassler, & Brissie, 1987; Renfro, 2003), lower quality teaching (Corenblum & Marshall, 1998; Doyle, 2012; Fiese & DeCarbo, 1995; Hinckley, 1995; Kozol, 1991; Ogbu, 1974; Renfro, 2003), and lower musical aptitude (Daniels, 1986; Dawkins & Snyder, 1972; Good, 1997; Rainbow, 1965; Rowntree, 1970;

Sergeant & Thatcher, 1974; Taebel and Coker, 1980; Van Zee, 1976). An important question is whether the differences in ratings can be more attributed to characteristics of the schools and music programs, such as the facilities and equipment, administrators, and teachers, or to the characteristics and culture of the students and their families, such as parental involvement and attitudes toward education and music.

All of these circumstances may encourage fewer low SES students to enroll in band or chorus, causing these programs at low SES schools to be weaker. Furthermore, we know that even if low SES students initially enroll in these classes, they are more likely than their higher SES peers to drop out (Albert, 2006a; Corenblum & Marshall, 1998; Kinney, 2010; Klinedist, 1991; McCarthy, 1980). This may be due to their need to work after school, family obligations such as taking care of younger siblings while their parents work, or the need to take remedial classes in the place of electives (Renfro, 2003).

Further Research

Further research into this topic is needed to isolate these variables to better determine the causes of the differences in ensemble achievement at contests. Admittedly though, this is hard to do in real-world educational settings. Nevertheless, it might be possible to eliminate variables, for example, by looking at similarly funded and staffed high and low SES programs, high and low SES programs with similar reported levels of parental involvement, or high and low SES programs with similar percentages of students enrolled in private lessons. In addition, future research should look at the outliers. Certainly not every high-SES school has band and chorus programs that are successful at contest, and there are low-SES schools that have music programs that are consistently

successful. Specifically studying these successful low-SES schools would be useful in developing a model for a successful music program in a low SES situation.

This present study presents a strong, clear case that there are discrepancies in music ensemble achievement due to SES. Nonetheless, it serves only to reveal these disparities. Future research must focus on what we can do to close the gap between high-SES and low-SES music ensembles. There are low-SES bands and choruses that have found a way to be highly successful at contest. Finding the similarities between these high achieving programs could give administrators and music teachers in low-SES situations a guide to follow.

Conclusion

It is evident that not all children are receiving the same opportunities for success through their school music programs. Too many low-SES schools have struggling music ensembles. Despite legislation to correct this trend, large differences in achievement due to SES remain. Texas has what is often called the "share the wealth" or "Robin Hood" plan in which funds are taken from property-wealthy districts and distributed to property-poor districts (Texas Education Agency, 2014). It is apparent, however, that this effort has not closed the gap between high-SES and low-SES schools. All children deserve a high quality music education, and we must work harder to provide the same opportunities for success for all students regardless of their socioeconomic status.
